Close Call

A warehouse safety lead asks one question and gets the few seconds that matter, with a fingerprint so someone else can check the words were not changed.

WHO USES IT

A safety lead on a site that already has aisle cameras. They are accountable for injuries. They do not watch the full recording.

THE PROBLEM

A shift produces hours of video. The useful part is a person standing next to a moving forklift. Finding that by hand means scrubbing the tape. A summary sent to a supervisor or an insurer has to stay checkable after it is sent.

WHAT THE PAGE DOES

They type “person close to a moving forklift.” The page returns a short list of cards. Each card has the clip, the start and end time, the camera, and the sentence the video model wrote. A button reloads that clip and checks a fingerprint of the camera, the times, and the sentence. If the words were changed, the check fails.

DEMO

Search the warehouse camera. Open one card. Read the sentence next to the frames. Press verify. The fingerprint matches the clip still in the index.

HOW IT IS BUILT

The footage is already indexed. Search runs on Cosmos captions and embeddings. YOLO has already marked people and forklifts. If the existing captions never mention a person near a forklift, one warehouse chunk is re-ingested with a prompt that asks only for what is visible: who is in frame, whether the forklift is moving, and whether a person is close to it. The page calls search and plays the clip. The fingerprint is a hash of that result.

LEFT OUT

No claim that a person is an AI. No phone-call scoring. No second camera unless the warehouse cards already work.

WHAT YOU KEEP

Tells scores a voice on a call and cannot yet show the evidence under the score. This card is that pattern on video: a claim, the exact sentence it came from, and a check.
